

3 WAYS TO PREVENT AIR POLLUTION

1. Proper Waste Management

Stop burning waste - burning waste releases toxic smoke that affects the lungs and the air. Things you can do instead: Recycling, composting and report waste burning to local authorities.

2. Use of Clean Energy & Transport

Coal burning and car fumes are major pollutants; supporting cleaner energy and transport practices can reduce the release of pollutants. You can reduce energy by turning off appliances you are not using and consider using public transport, where possible.

3. Plant Trees and support green spaces

Trees clean the air, reduce the microclimates around our homes, and support biodiversity. Join a community or school tree planting initiative to reduce impact of air pollution.
